Small apps. Right when you need them.

Small ideas. Bring everyone together.

A poll, a quiz, a lucky draw.
Create an app for your moment, then share it with a link.

↳ Temporary problem. Temporary software.

PROJECT INFO — Team 35

MinintApp

A platform for creating Flash Apps for a group's immediate needs.

Team	95LAB
Members	Hiếu Nd · Thức Nguyễn · Mai Phan
Demo	minintapp.io.vn ↗
Repository	github.com/95Lab/minintapp
Direction	Option 2 — AI-Native Products & Operations

01 · THE PROBLEM WE ARE SOLVING

Small, urgent, and shared by the whole group.

Many moments in group life call for a small tool that everyone can use together, but only for a few hours or days.

/01
Learning
A teacher or project team quickly creates a web app to practice lesson material.

/02
Group meetings
Agree on a venue, meeting time, or drinks without asking everyone individually in a group chat.

/03
Workshops
Start with a quiz, then open feedback questions one at a time to match the pace of the session.

/04
Classrooms
Run a quick check, collect surveys, pick someone to answer, or split the class into groups.

/05
Trip expense management
Spin a wheel to pick a restaurant, record shared expenses, and track total spending.

/06
Any spontaneous idea
A registration form, a mini game, or a quick request for feedback.

WHAT THEY SHARE

01 They arise unexpectedly
02 Many people take part
03 They have a short lifespan

Existing tools often require **registration and setup**, or **a different application for each task**. Building a custom application takes disproportionate effort: no one wants to build an entire system for something needed only today.

02 · THE SOLUTION WE BUILT

Flash Apps — use them now, end them when you're done.

A platform for creating and using **Flash Apps** — small, ready-to-use apps — from a description in Vietnamese or English, or from a template.

01 — Tell us what you need
Describe it in words or pick a ready-made template.

02 — Share a link/QR
Invite everyone to join on a phone or computer.

03 — Join in
Submit answers and see the results together.

04 — End it
Close the app when it is no longer needed.

THE LIVE DEMO INCLUDES

minintapp.io.vn

AI app creation (OpenAI)

AI

Users discuss their idea with AI, confirm the requirements, and choose a lifetime. AI turns the request into an app configuration, checked for structure and rules before the UI is rendered from supported blocks.

1 hour · 24 hours · 7 days

7 ready-to-use templates, no AI

Pick a template and go — created directly, no AI call.

Poll · Quiz · Participant draw · Choice wheel · Multi-field survey · Step-by-step survey · Expense tracker

Participant experience

Open a link or scan a QR code on a phone or computer without an account; enter a display name, submit answers, and see results update in real time.

Host management page

Get a link/QR and monitor responses; close, reopen, or end an app; reveal quiz answers and run lucky draws; extend, export CSV, and remix — describe changes for AI to build a new version from the app and its results.

"My apps" workspace

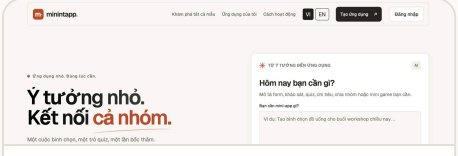

View counts of all apps, running apps, apps being deployed, and apps needing attention (errors or expiry); search by ID or domain, filter by status, and quickly access the template library.

Operating platform

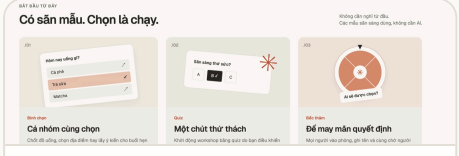

Persistent Supabase storage with Realtime sync across devices; a Control Plane, queue, and Worker manage sandboxes and per-app data. Bilingual VI/EN interface, optimized for mobile.

The range of apps AI can create depends on the functional blocks and rules currently supported by the runtime.

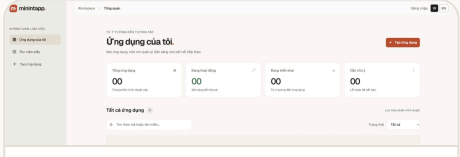

SCREENSHOTS FROM THE LIVE DEMO

Home — shape your idea with AI

Template library — pick and go

My apps — manage every app

03 · ALIGNMENT WITH A BUILD DIRECTION

From a description to a working app.

Bring the idea. MinintApp gives everyone a place to join in.

OPTION

02

AI-Native Products & Operations

AI turns a description of a need into a working application. The platform handles the interface, data, sharing, and lifecycle. People without programming skills can create a tool for their activity without setting up infrastructure.

Describe a need → AI → Interface · Data · Sharing · Lifecycle

NEXT STEPS

Expand the functional block library for more complex scenarios:

- Coordinating family caregiving shifts ↗
- Capacity-limited workshop registration and check-in ↗
- Group meal ordering ↗
- Orders and inventory for a weekend fair booth ↗

04 · HOW WE USED CODEX

Codex assists. People sign off.

We used Codex throughout development, from analysis to documentation.

/01

Analysis & design

Analyze requirements, break down tasks, and design contracts between AI, backend, and UI.

/02

Development

Develop the product interface, APIs, data adapters, and deployment components.

/03

Testing & docs

Write tests, review changes, help fix bugs, and prepare documentation.

Clear scope & acceptance criteria → Codex implements → Member reviews → Checks run

Each task has a clear scope and acceptance criteria. The responsible team member reviews the output and runs the relevant checks. **Codex supports the development process; the product's app-generation flow uses OpenAI.**

✳ OUR MESSAGE

Small tasks deserve their own tools. Moments are better together.
